

Modelling Study for Geodynamics' large scale project development.

Geodynamics Ltd has applied for a **\$75 million grant** from the Australian Government's \$500M Low Emission Technology Demonstration Fund (LETDF). The reservoir modelling study for assessing **the viability of large scale power production** from the Cooper Basin reservoir was prepared by Q-con's modelling division.

The study investigated the thermal and hydraulic long term reservoir performance (for a geothermal field with >40 wells)

under various reservoir exploitation schemes. The models were calibrated using well test data and seismic observations from 2003 – 2005.

For more information see Geodynamics' latest Quarterly Report June 2006:
